EPL Recruitment Memo

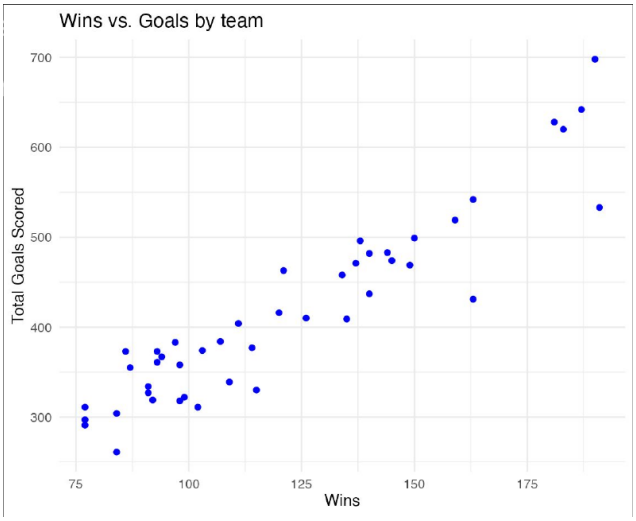

Team trends and player evidence from the supplied scouting deck | Brighton Allen | 7 November 2026

> **Recommendation Advance Alejandro Gomez, Wissam Ben Yedder, Domenico Berardi, Borja Garces, and Joshua Kimmich as the five recruitment targets selected in the deck. The charts below explain the performance signals behind that shortlist.**

Team outcomes

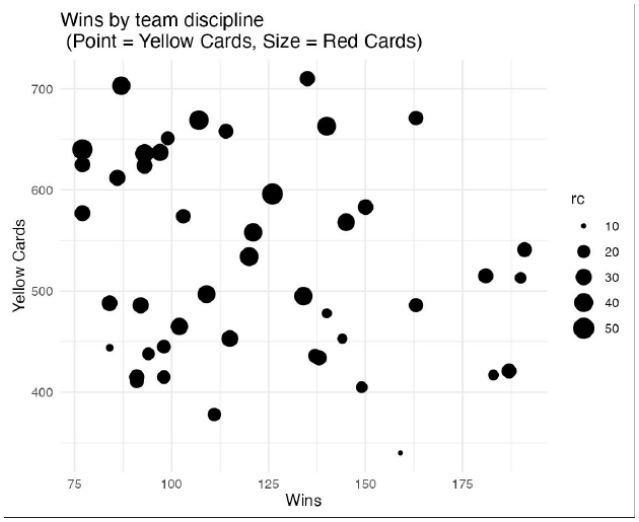

Teams with higher total xG generally have more wins. This supports targeting players who create or reach good scoring chances; the team-level pattern does not prove an individual signing will add wins.

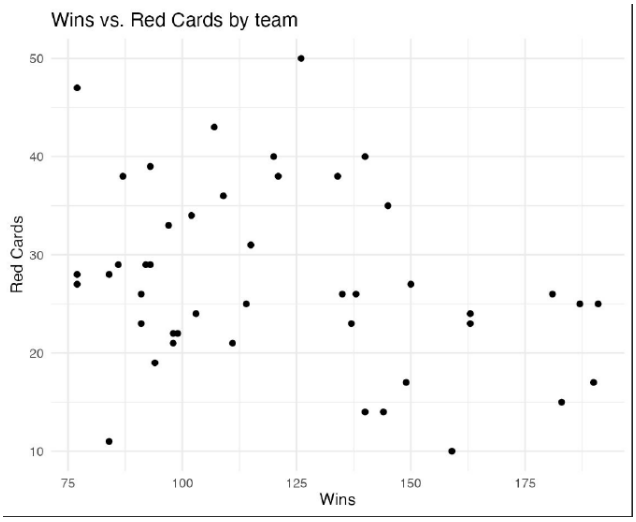

Teams with more goals also tend to record more wins. Actual scoring complements xG as a team-performance signal, but does not establish the effect of a particular player.

Discipline

Yellow-card counts vary widely across teams with different win totals; bubble size shows red-card counts.

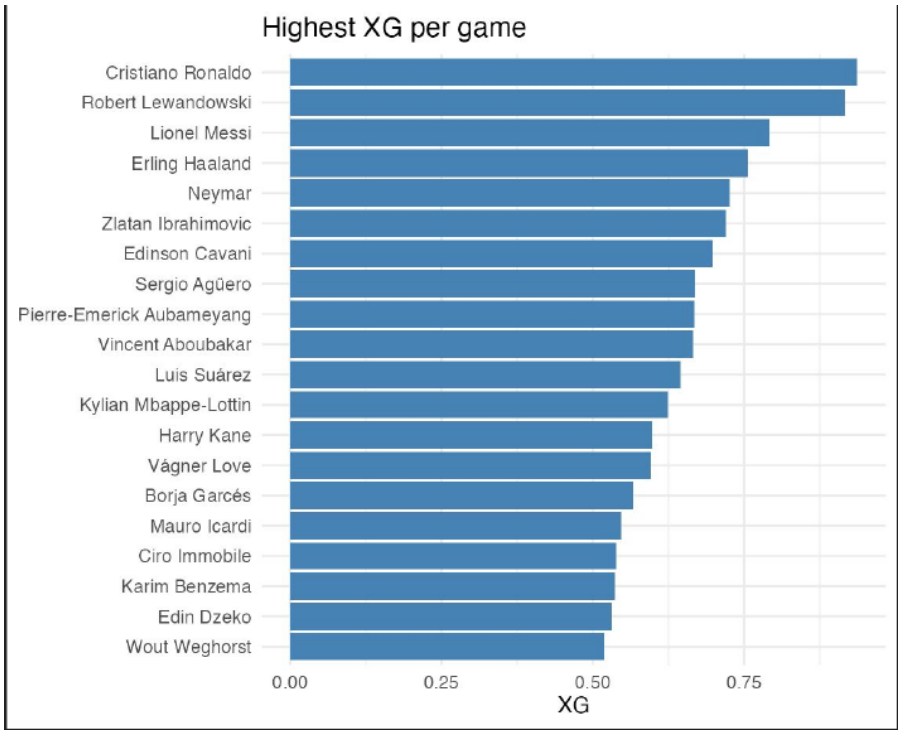

Red-card counts also show no clear pattern with wins.

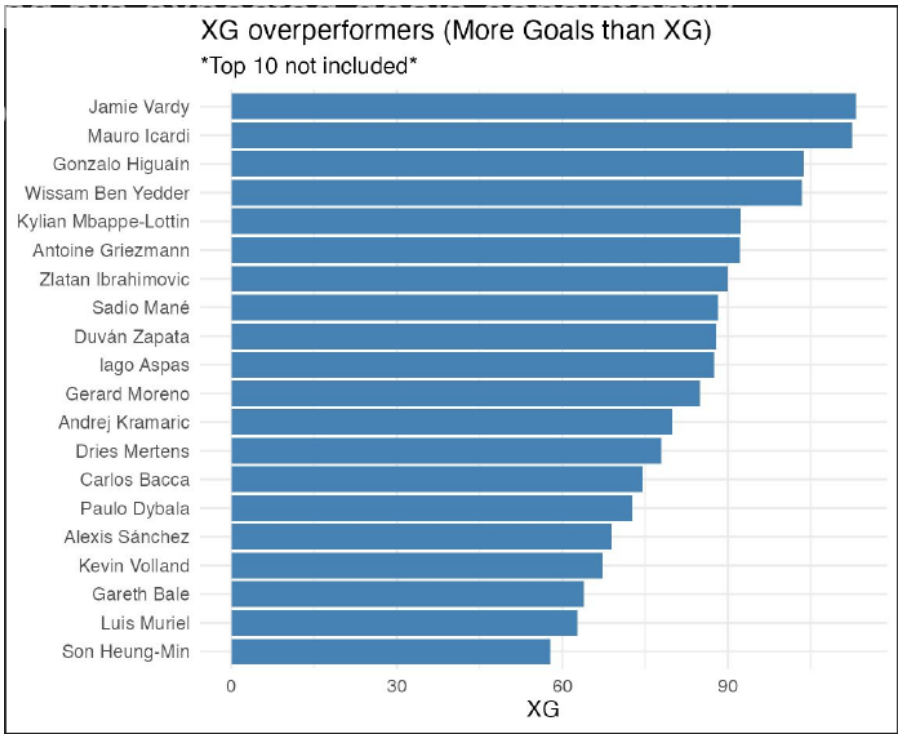

Taken together, the plots do not show a strong relationship between card counts and wins. The deck therefore does not prioritize discipline in this recruitment screen.

Player scoring signals

The player charts translate the team-level goal findings into individual screening measures.

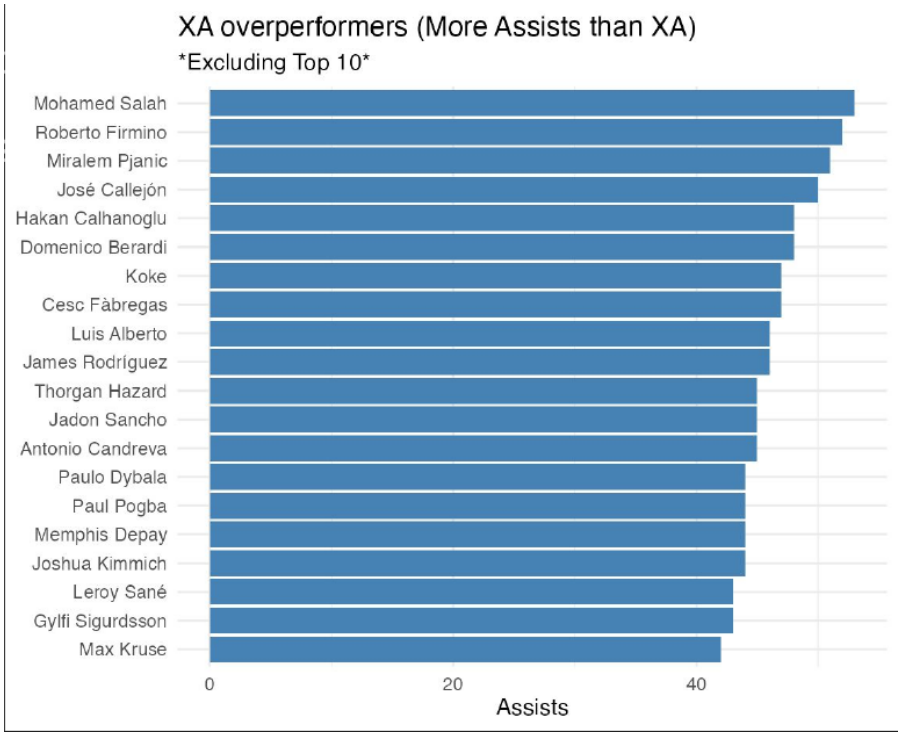

Expected goals per game. A higher rate reflects more and/or better scoring chances per game. The deck uses this measure to identify players who regularly reach promising shooting positions.

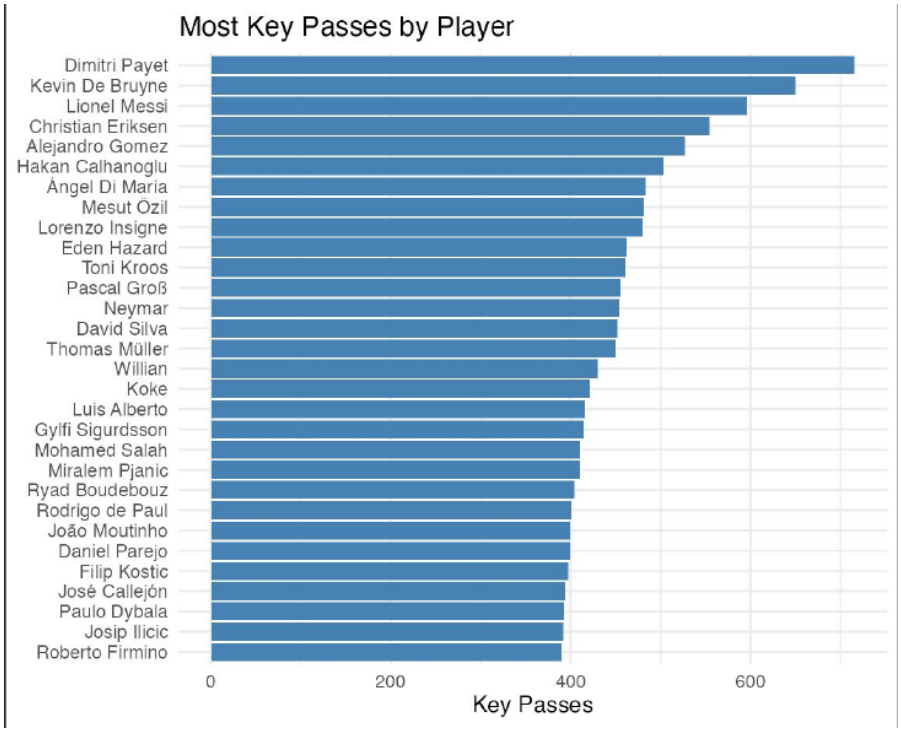

Goals above expected goals. The chart highlights players whose goal totals exceed xG and notes that the top 10 are excluded. The deck treats sustained overperformance as a finishing signal; the chart alone cannot distinguish repeatable skill from variation in sample and shot outcomes.

Creative contribution signals

The remaining player charts focus on assists and passes that create shots.

Assists above expected assists. These players recorded more assists than the xA attached to their chances, with the chart excluding the top 10. This is an end-product signal; teammate finishing and the analysis period also affect assist totals.

Key passes. A key pass leads directly to a shot, so higher totals point to frequent chance creation. The deck uses this as a way to identify creative players.

Five players recommended for recruitment

The names and rationale below preserve the evidence in the final slide notes; no additional candidates have been added.

> **RECOMMENDATION Direct recruitment effort toward these five players, using the evidence recorded in the deck.**

PLAYER	EVIDENCE IN THE DECK NOTES
Alejandro Gomez	High key-pass volume, indicating a strong chance-creation profile.
Wissam Ben Yedder	Described as a lower-cost option who has outperformed xG over time.
Domenico Berardi	Described as a lower-cost option who has outperformed xA over time.
Borja Garces	Unknown, inexpensive profile; the notes place his goal numbers among the best in the world.
Joshua Kimmich	A defender who also outperforms xA.
